

Don't tell me you want to go fish.

Tell me the fish you want to catch.

*Adult Social Care
requires precision,
not just a net.*

Boulders blocking the natural flow.

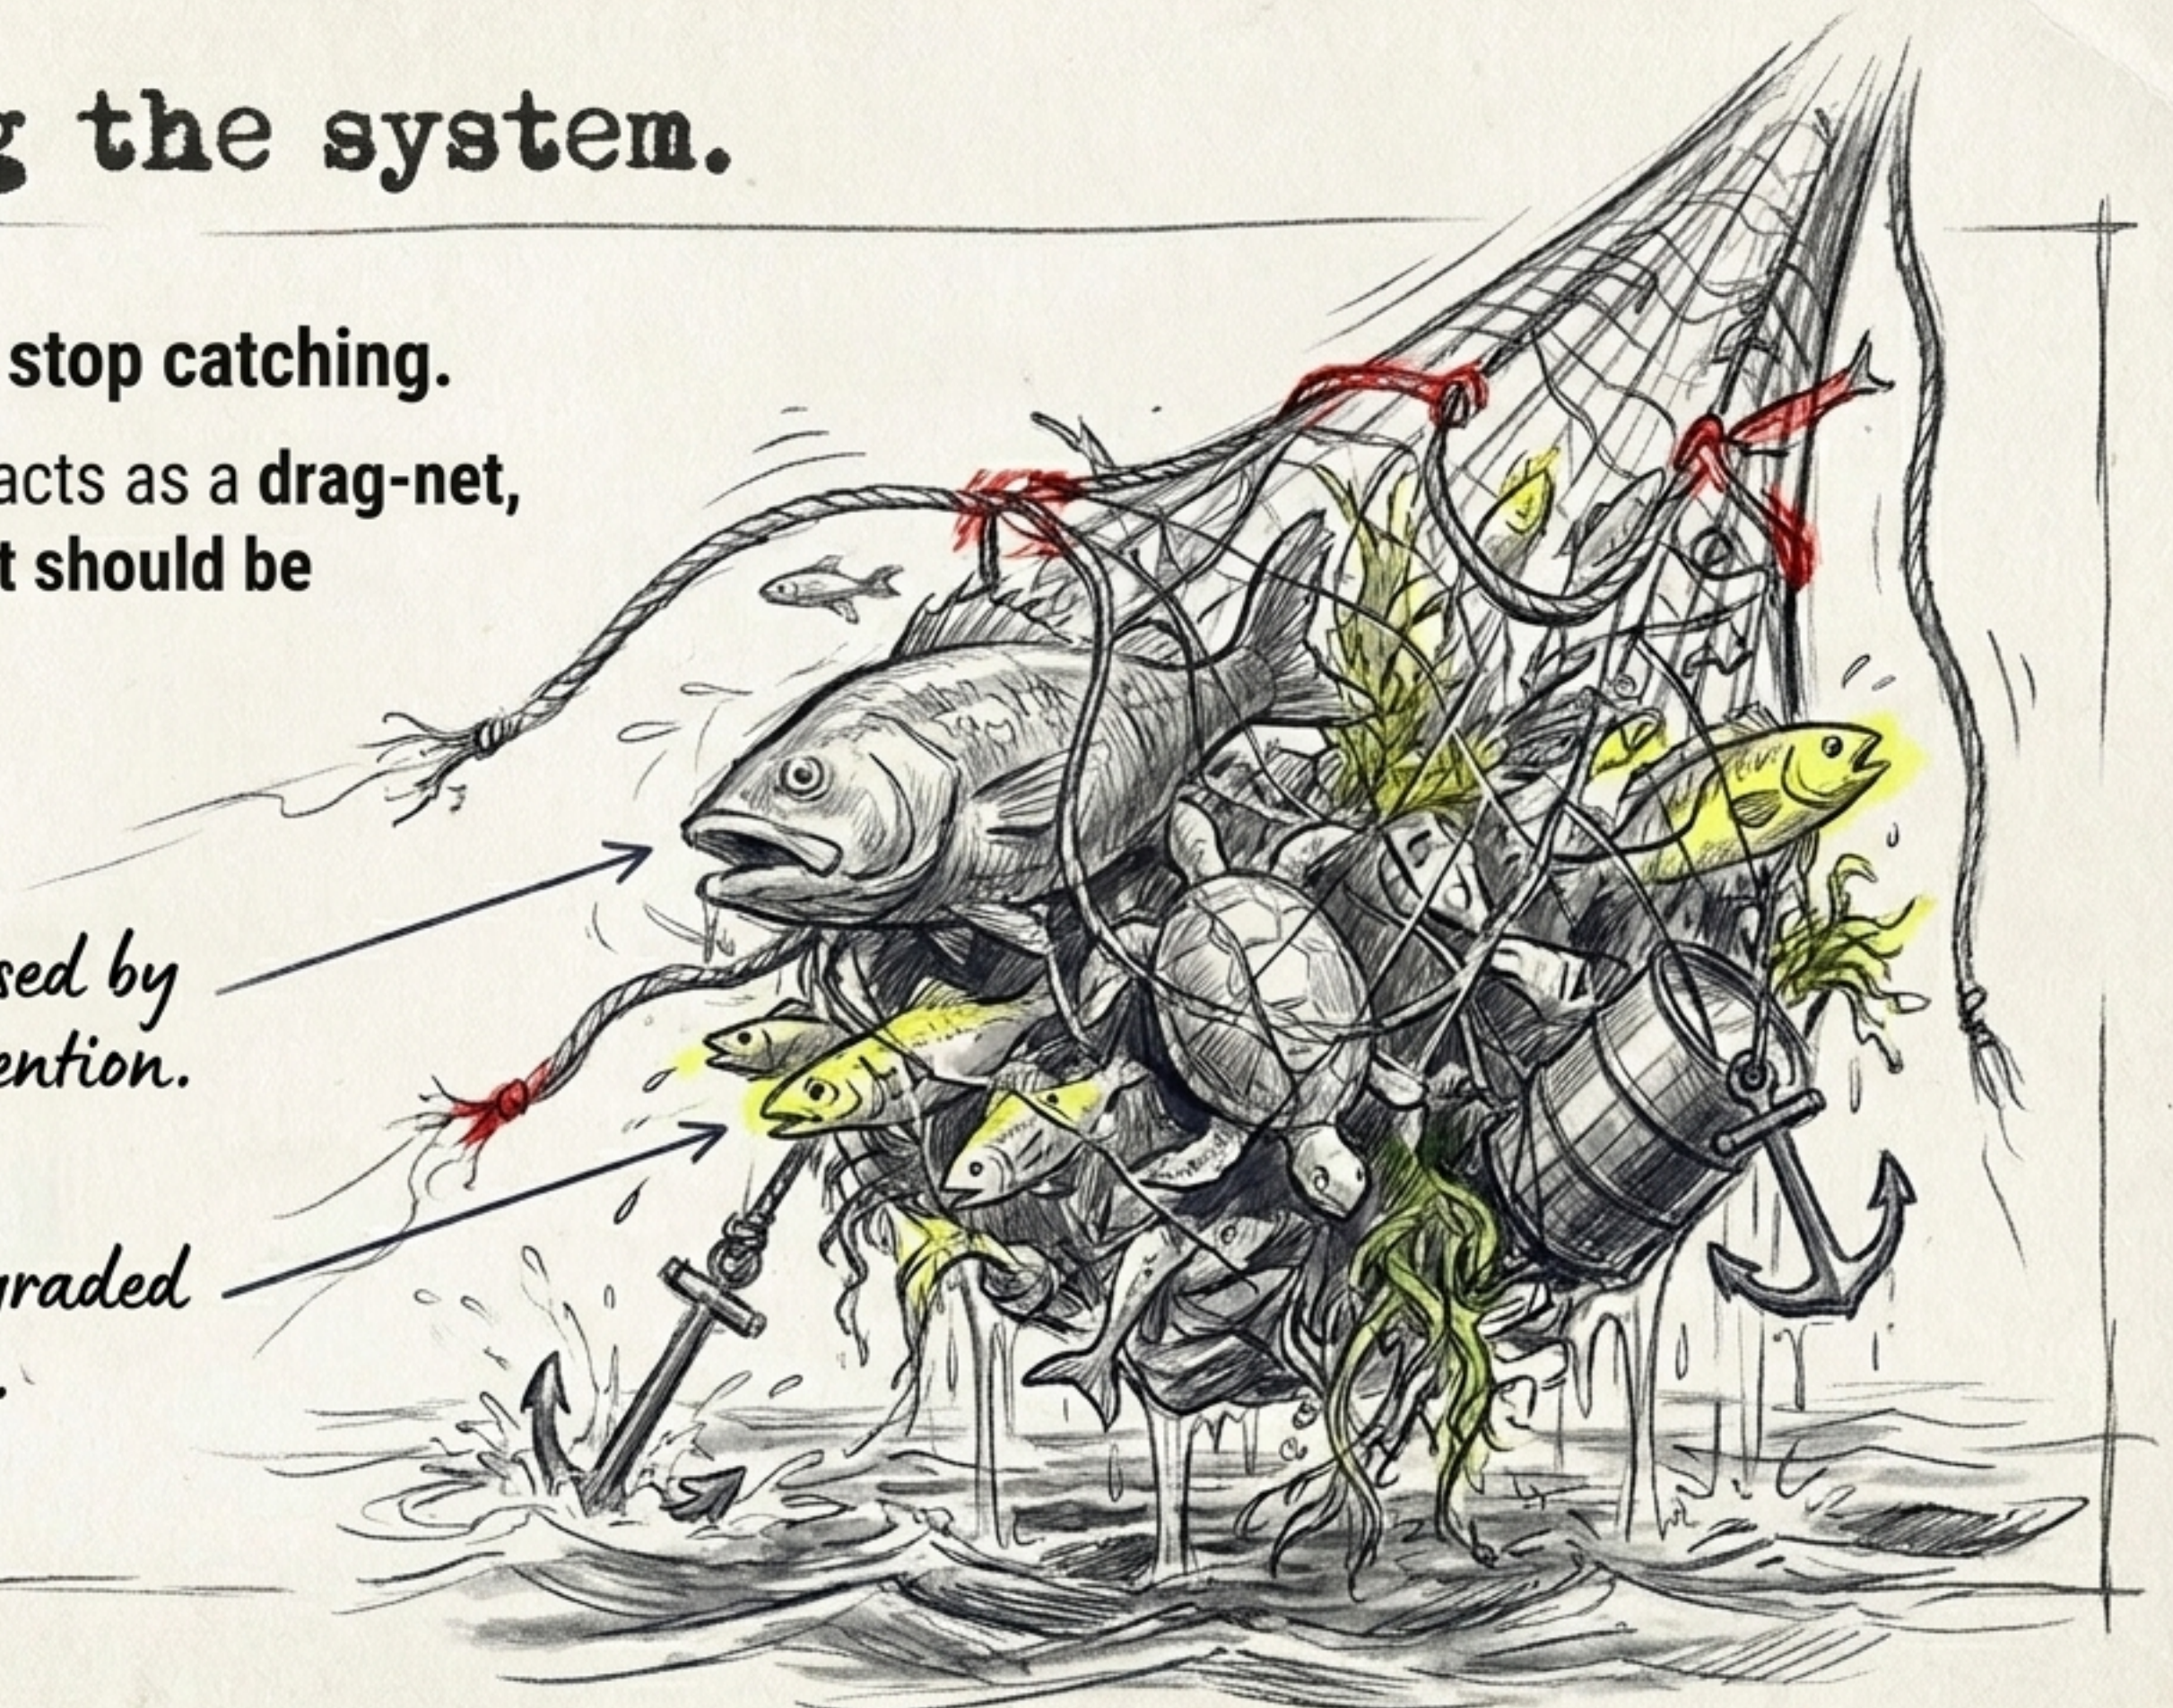

Overfishing the system.

 **The fish we must stop catching.**

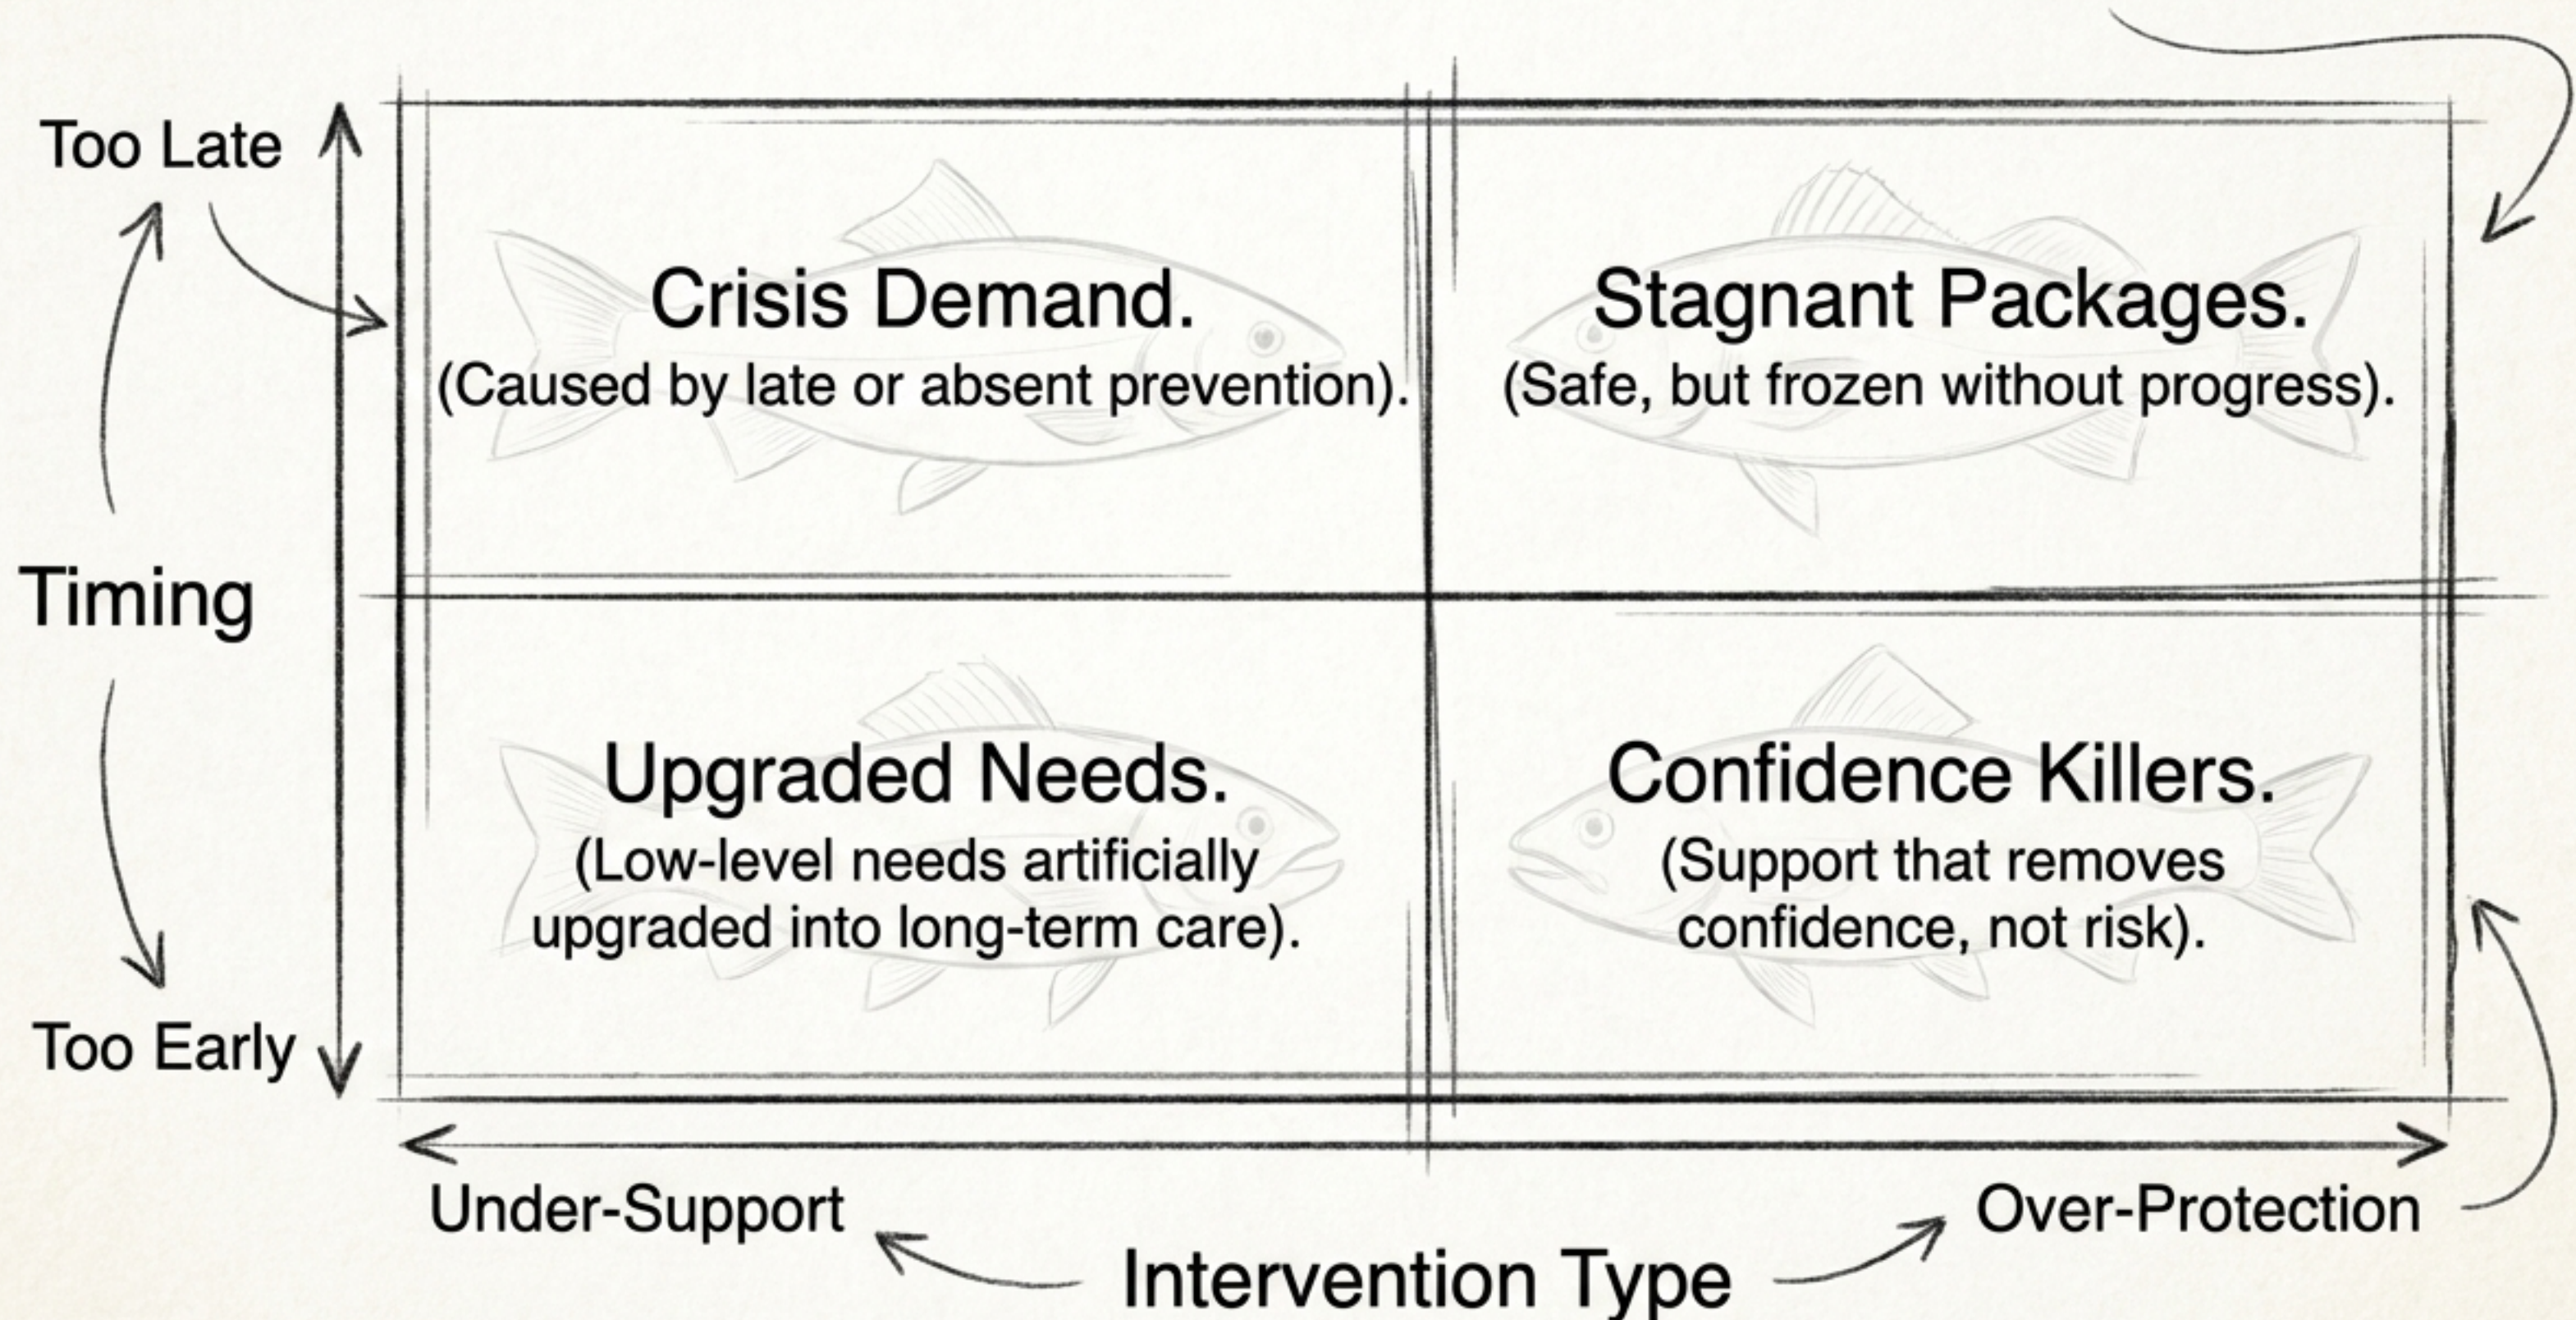

The current approach acts as a **drag-net**, hauling in catches that should be released immediately.

Crisis demand caused by late or absent prevention.

Low-level needs upgraded into long-term care.

A taxonomy of the wrong catch

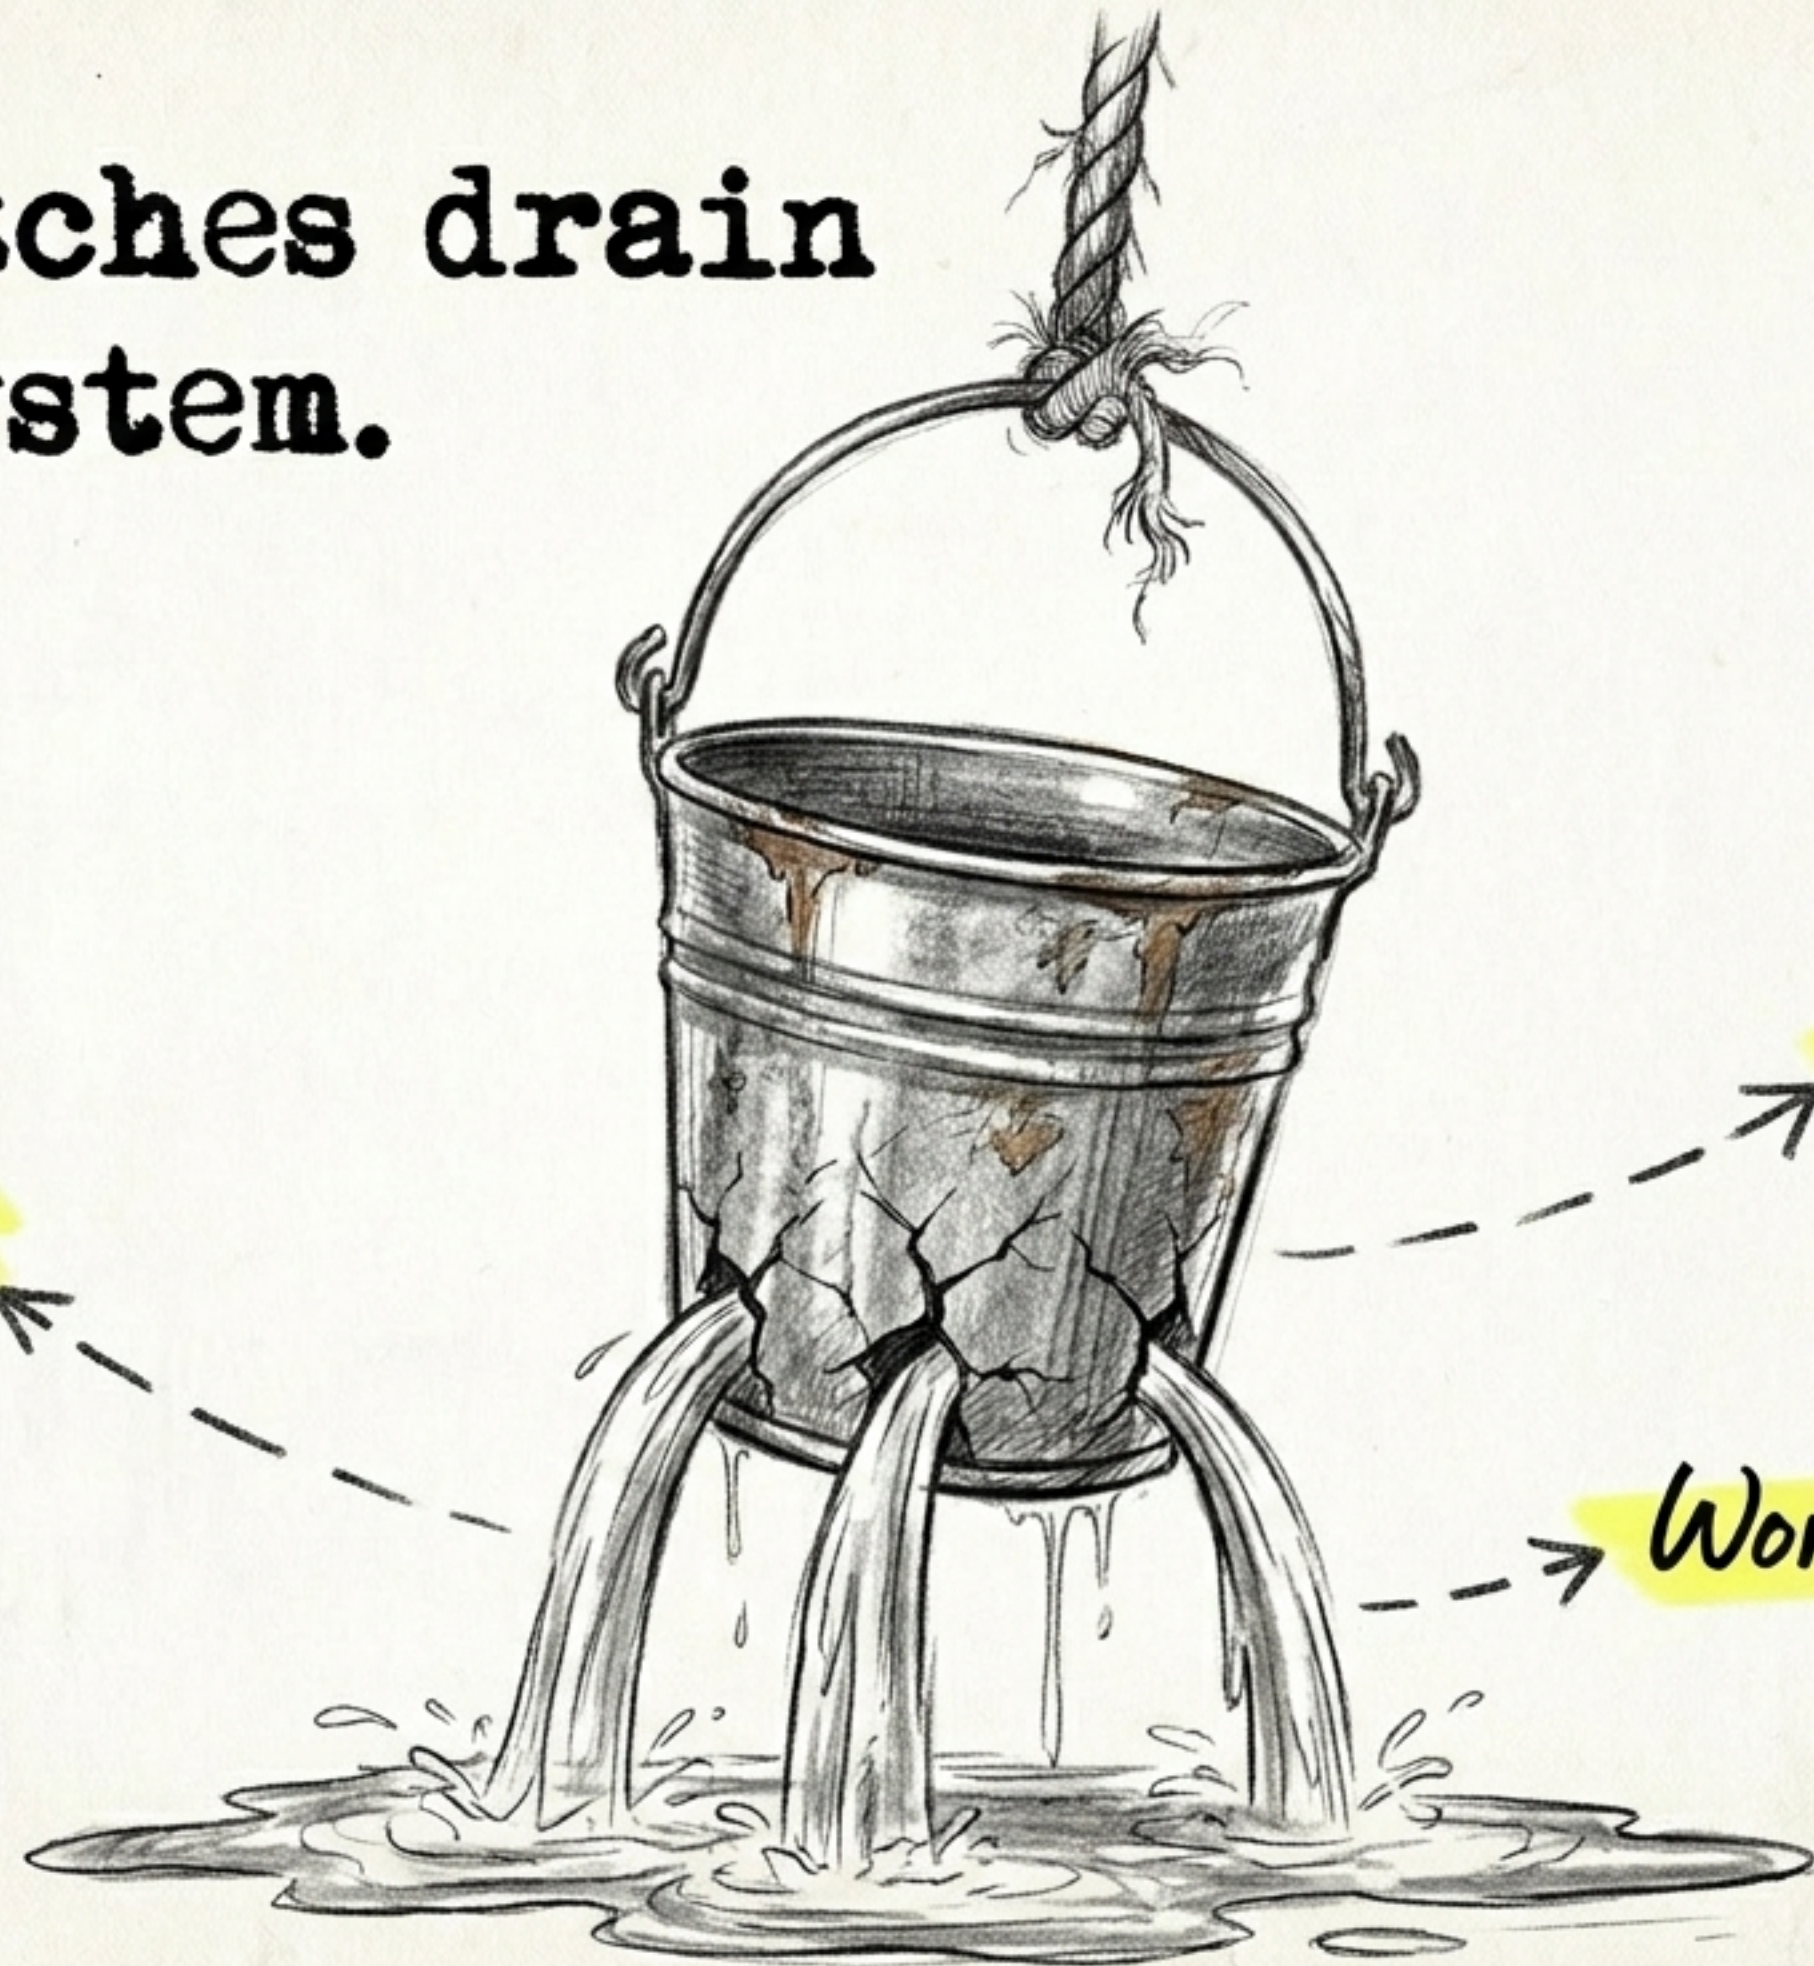

These catches drain
the ecosystem.

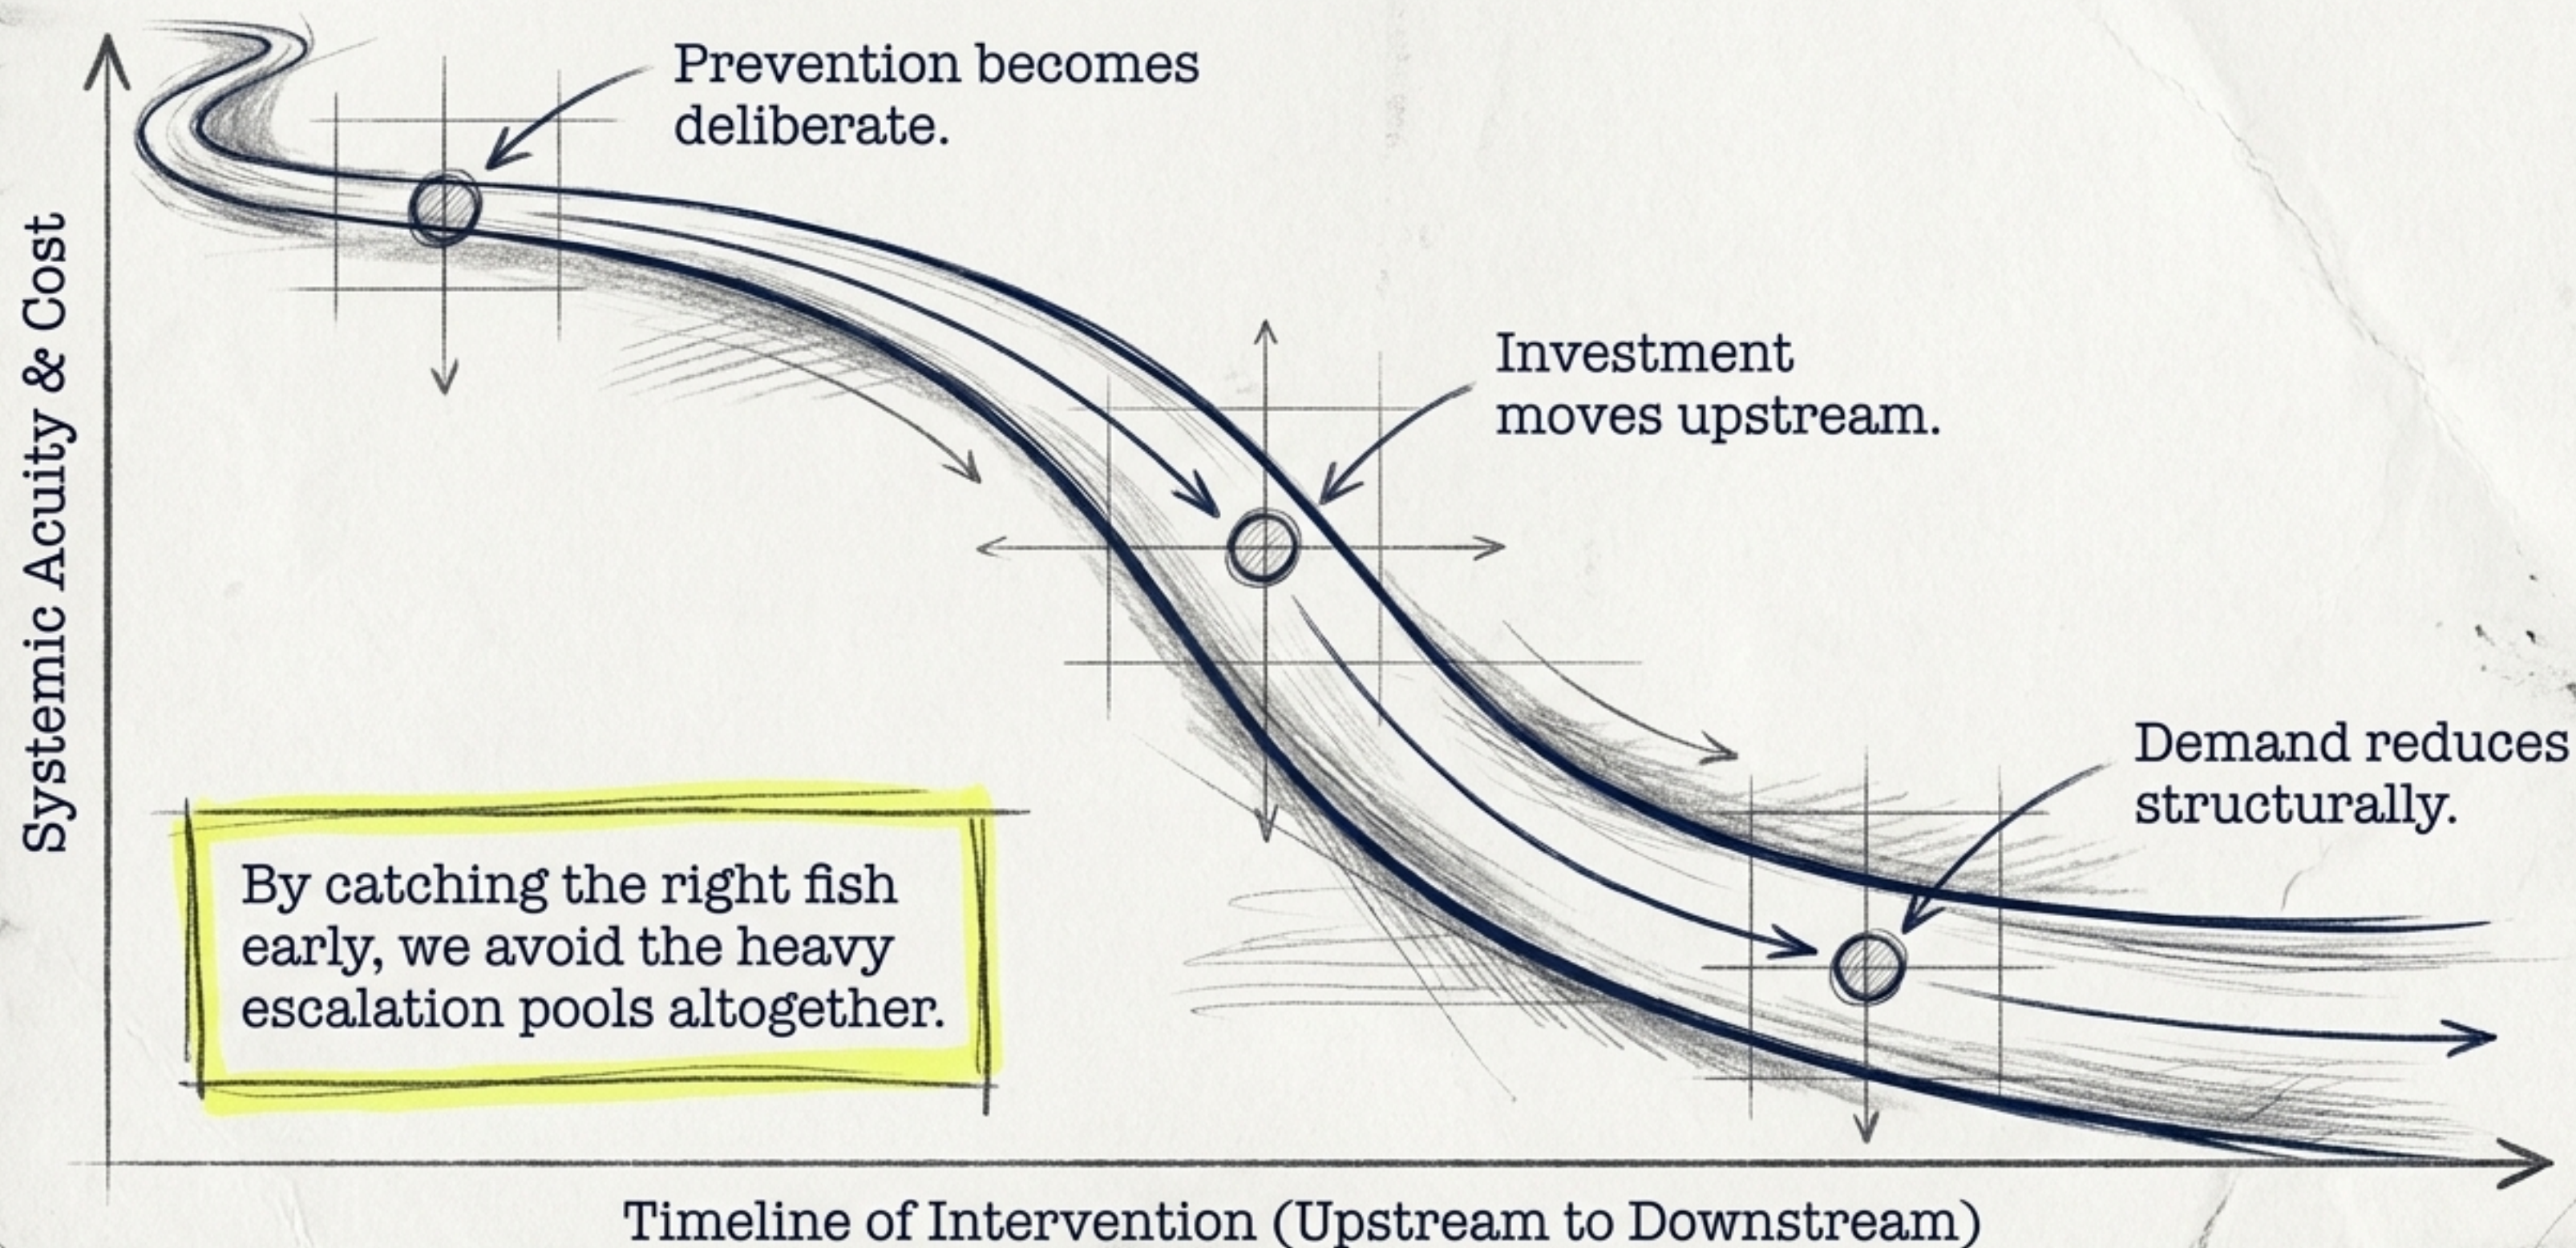

Capacity.

Budget.

Workforce morale.

Moving upstream changes the downstream reality.

The one rule that changes everything.

If we can't label it — we shouldn't land it.

What this means for executive leadership.

Stop asking...

~~How do we
manage rising
demand?~~

Ledger
entry for
strategic
shift

Start asking...

- Which fish should never reach our net?
- Which fish are staying too long?
- What data tells us where to fish earlier?

Two diverging paradigms of care.

Adult Social Care must NOT become:

- ✗ A hotel with no checkout.
- ✗ A drag-net for social problems.
- ✗ A system built only on protection.

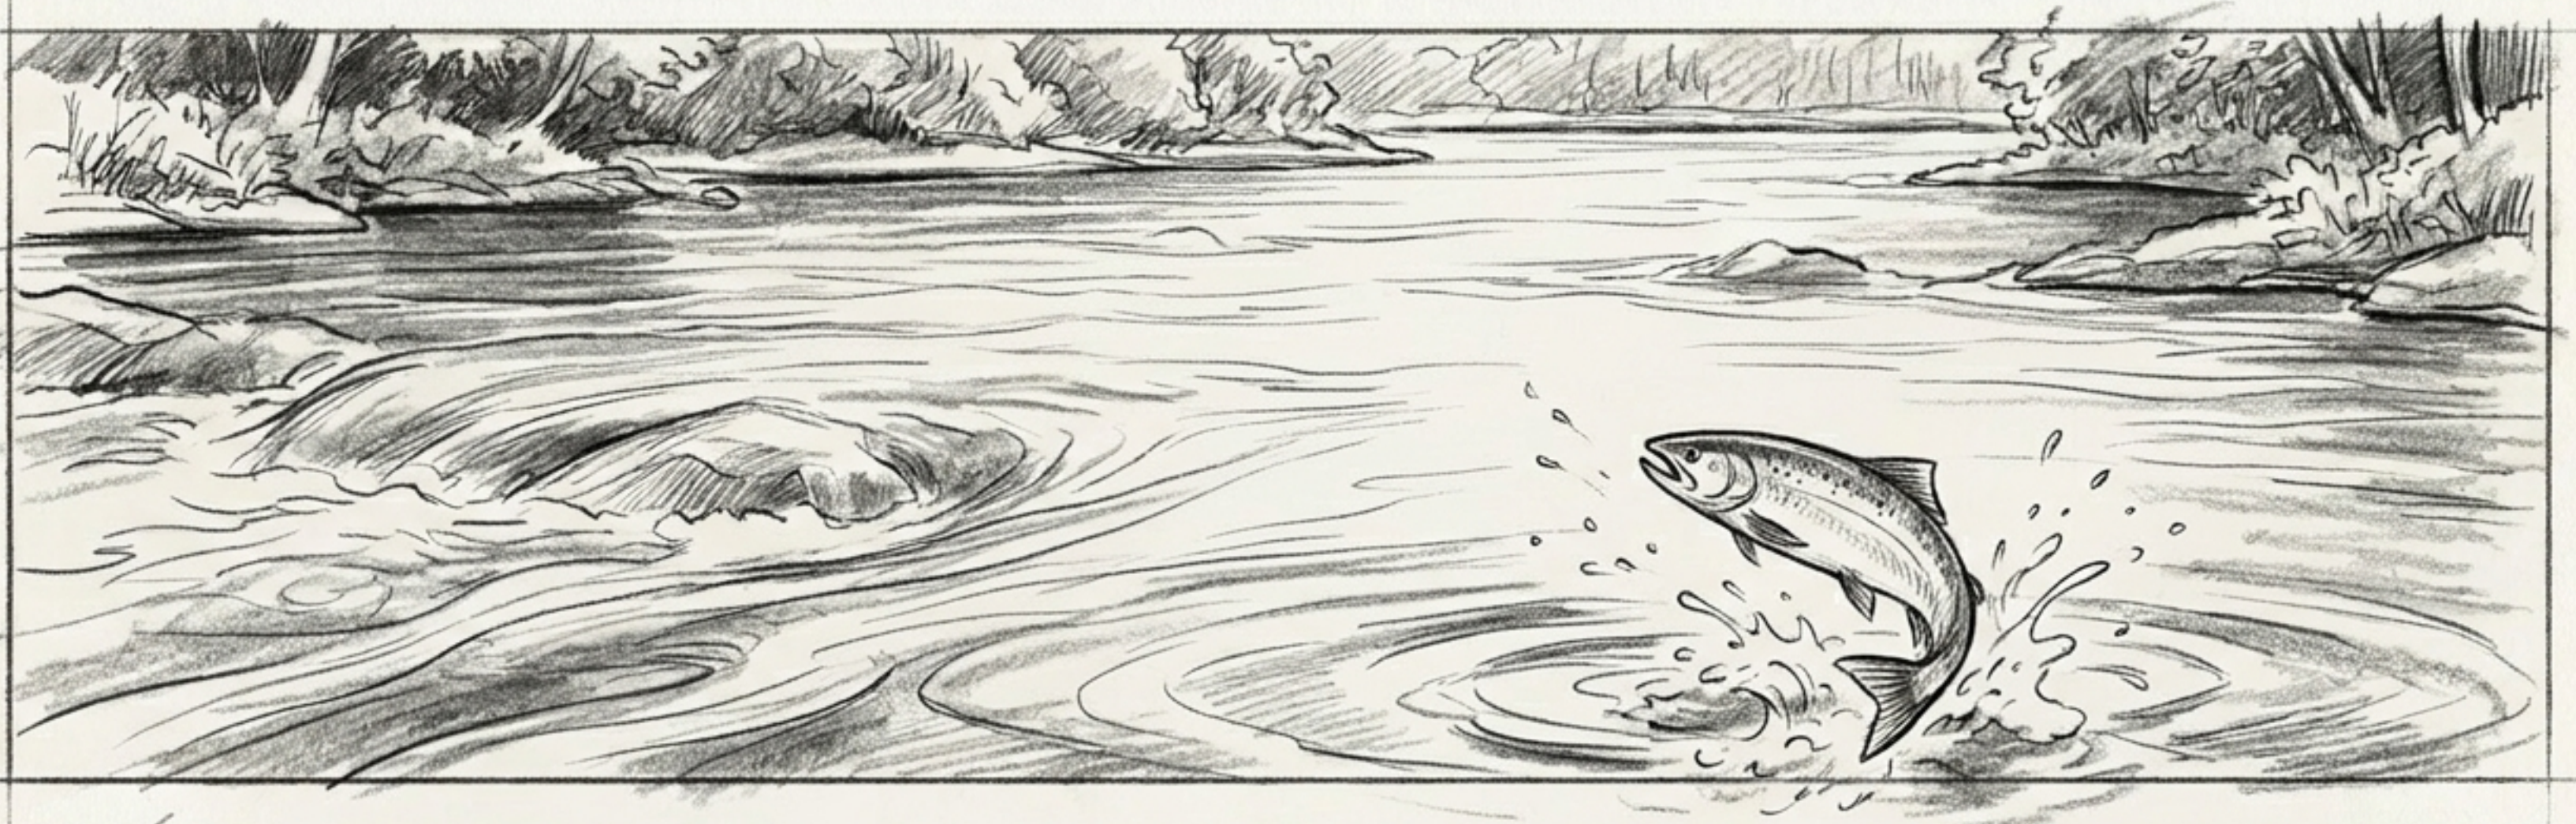

Adult Social Care MUST become:

- ✓ A skilled fishing operation.
- ✓ Catching the right fish.
- ✓ Releasing them back to stronger waters.

Shift to proactive model, not reactive containment.

Returning to stronger waters.

*The ultimate measure of our system is not how many we keep in the net,
but how many we successfully return to the flow of their own lives.*
